

[MUSIC PLAYING]

My name is Dr. Gary Gershony. I'm an interventional cardiologist on the staff at John Muir Health. I have a number of responsibilities, including treating patients with cardiovascular disease using the latest techniques in a minimally invasive fashion, whether it's for coronary artery disease or for structural heart disease, which generally means problems with malfunctioning heart valves and other structures in the heart.

I'm also the medical director of cardiovascular research, education, and technology. And as part of that role, we are committed to providing to patients in our community the most advanced and minimally invasive techniques. Not only are we committed to being compassionate in our care and to listening to our patients' concerns, but also to being the provider of the most advanced techniques in cardiovascular medicine available anywhere in the United States.
