

SPEAKER 1: Essential tremor is a progressive neurological disorder that can cause tremors in the hands, head, and voice. The tremor occurs, or is most noticeable, when the affected area is in use or moving. Deep brain stimulation can significantly relieve tremors and improve quality of life. Watch Jack as he demonstrates his DBS device, showing us the tremor with the device turned off and the dramatic change once the deep brain stimulation device is turned on.

SPEAKER 2: My device is off. I'm going to give you an indication of how much trouble I have writing my name. As you can see, it's not going too well right now.

You certainly can see what the problem is. Hey, I got a Jack out there and the J doesn't look too good. Now I'm going to turn the device on, see what happens here. OK. This is with the device on.

Amazing difference. This is what I'm talking about. It's just so much different. This has given my life back to me. I would recommend anybody that has any kind of a tremor, that is concerned about it, to talk to their doctor or their neurologist. Get it taken care of because it's a life changing experience. There's no question about it.
