

**SPEAKER 1:** So in summary, ECP is a dendritic cell therapy. ECP makes the dendritic cells physiologically, and those dendritic cells have the potential to be tuned up or down in terms of function. That, like every empirically developed therapy, which is a large number of different therapies, was a difficult thing to find in its own special kind of investigation, but opens the door to personalizing ECP therapy in all of the avenues that it does already follow and may follow in the future.

In terms of potential application more efficiently to the diseases in which it's already used, these principles in accordance with guidelines that are provided by ACE, and that are available online as well as in the literature, are hopefully very helpful to all of you now. It's been a pleasure. This is clearly something I've been involved with for the large majority of my career. These are the most exciting days yet.
