

SPEAKER 1: Angiokeratomas are the hallmark of Fabry's disease. They are one of the typical manifestations of Fabry's disease. And we as dermatologists are positioned to diagnose them early, and by that, be able to treat the patients early before they develop end-stage organ diseases.

As dermatologists, we have this position of seeing the skin is there. We just don't need to perform difficult or very invasive procedures. We just need to see. And we are in this very good position to diagnose Fabry's disease quite early.

So if you have any doubts, you can perform a skin biopsy just for HNE. And that'll be very helpful too. And if you have any doubts, then you can ask or team up with colleagues to be able to end up getting the correct diagnosis and be able to give the patient the opportunity of an early treatment.
