**HELFAND:**

So our urology division has a very large team of researchers that are regularly interacting with our urology department. This is very important because we believe in translational care, meaning that the research that we perform and conduct is directly translated into patient outcome and their experience.

As such, we have a very large team that includes cancer biologists, epidemiologists, statisticians, behavioral biologists, as well as geneticists, who are focused in on advancing cancer care and specifically in urology, but also the care of benign diseases, including kidney stones, as well as benign prostatic hyperplasia.

We regularly interact with this team. We have regular meetings. We have been shown to be a well established team of researchers and have published over 200 articles in peer reviewed journals in the past decade.
